

SOLUTIONS FOR PRESS BRAKES RETROFITTING

This is a device with which you can really change the way you work with your press brake; therefore, Triveneta Impianti proposes a product that can increase the performance of your machine tool and at the same time make it safer.

It has a simple name, how simple it will become to bend even large sheet metal: Up!

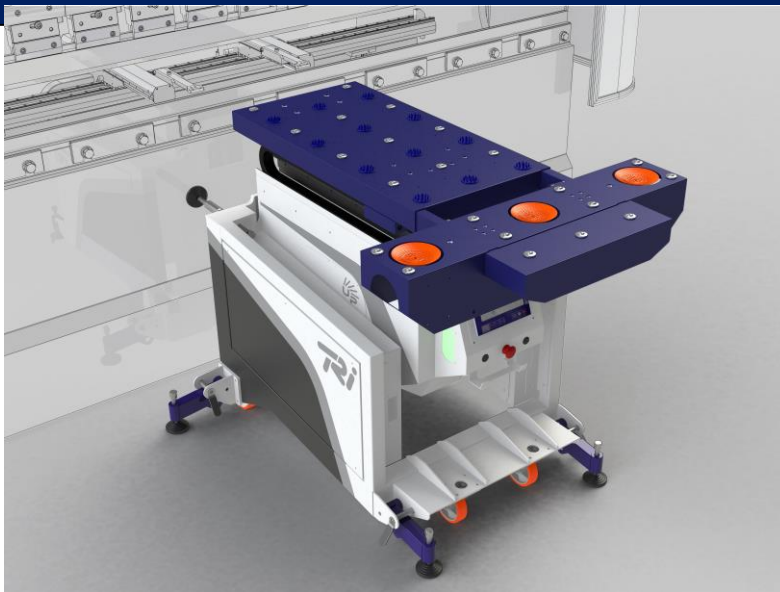

You don't have to change your press brake, it's an added device that follows the sheet to work in graph to eliminate the risks for the operator, and we use the singular "operator" because only one person will be enough to handle even very heavy pieces and big dimensions!

Connect Up to any CNC of any press brakes and you can quickly use it on every machine tool in your company.

Furthermore, it is possible to choose between two models of Up:

1. UP FRAME – Basic model with standard performances
2. UP UNIVERSAL – “Premium” version with advanced performances
